

Homelab-Omada-Setup Guide

How to add a Gateway to the network using OC200 Controller:

<https://support.omadanetworks.com/eg/document/13038/>

Vlan 10 Management Configurations:

← Edit LAN

1 Network Parameters 2 Select Device Port 3

Basic Configuration

Name: Management

DHCP Server Device: Homelab-Router

VLAN Type: ☒ Single ☐ Multiple

VLAN: 10 (1-4094)

Gateway/Subnet: 192 . 168 . 10 . [redacted] / 24 Update DHCP Range

Gateway IP	192.168.10.1
Broadcast IP	192.168.10.255
IP Count	254
IP Range	192.168.10.[redacted] - 192.168.10.254
Subnet Mask	255.255.255.0

DHCP Server: ☒ Enable

192 . 168 . 10 . [redacted] - 192 . 168 . 10 . [redacted]

Since the router is a DHCP server, put whatever range you want, and have a longer timeout lease. The best thing would be if you put the IP as static, once the IP address has been given by the router. Makes it easier when troubleshooting.
